

4x4 Winter Experience

Driving modes for 4x4 models

Off-road mode

- › This feature optimises the settings of the driving stability systems (ABS, ASR, ESC and others) to off-road driving; the accelerator pedal characteristics are flat and the DSG gearbox shifts at higher revs.
- › The Karoq and Kodiaq can provide off-road information on the infotainment display, including steering angle, coolant temperature, oil temperature, compass and altimeter.
- › Available for the Kodiaq and Karoq model series, as well as for the Octavia Scout and Superb Scout special models

Snow mode

- › For better traction, the ASR increases the wheel slip, the power steering is stiffened and the adaptive chassis switches to Normal mode. The gearbox shifts to higher gears at lower revs and the accelerator pedal needs to be pressed more for higher engine performance to avoid wheel slip.
- › Available for the Karoq and Kodiaq model series

Traction mode

- › Designed for driving on unpaved or slippery surfaces. All-wheel drive is constantly active at speeds of up to 20 km/h. It also optimises the torque distribution and the settings of the optional DCC dampers to ensure maximum traction.
- › Available for the Enyaq iV and Enyaq Coupé iV
